Dear Denis,

Thank you for listing me as one of the coauthor! This draft is very clear that I have understood the whole experiment now. The following are some comments and suggestions:

1. Page 4: the font in figure 1 was not correctly displayed since I don't have Pelli font on one of my laptop, but I guess the text will be replaced by a picture in later edition?

2. Page 6: You mentioned "As in Regan's chart, no matter where the observer's eye lands on the screen, a target will be imaged on the observer's fovea." I know this could solve the problem of bad fixation of some patients, but maybe it would be better if you explicitly express the benefit of using this repeating chart method, responding to what you said in the abstract that one of the problems of current tests is "require good fixation"? Or maybe the idea has already been expressed well, then just ignore this suggestion.

3. Page 7:

"If correct (one of the targets), it is followed by a faint beep. We do not mention the beep in our instructions." Is there any explanation of why there is a faint beep, or what purpose may the beep serve?

"Further typing of the same key, after the first are ignored." This sentence reads weird, maybe you don't need the comma here?

Hope these help.

Best,  
Xiuyun

dear sarah, ml, xiuyun, and hormet

Can you read and comment? this draft is in good shape except that the RESULTS section is empty. i'm still working on the graphs, and will add them over the next few hours. however, i will need to submit this ASAP to F1000Research and this draft, while good, will surely benefit from your comments and improvements. The conclusions hardly depend on the Results, because this is more of an announcement than a research finding.

i will send a new draft as soon as the Results graphs are in place, in a few hours.

best  
denis
